- Value

From Value by Design

(2011)

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University 🂈

<u>Complex adaptive system</u> (CAS) = Freedom to act in ways that are not always predictable, and whose actions are interconnected so that one agent's actions change the context for other agents

From "complexity sciences" by Zimmerman and colleagues.

Simple "Yes / No"

Known Elements

Predictable outcome

Culture before ATB

Low provider autonomy

Aim : Reliability

Check list or forcing function

Complex "? Maybe"

they can change

Element partly known, unit

Essentially unpredictable

Shared aim, relationship

Co - morbidities, Payer

High provider autonomy

Aim: Resiliency

situation

Complicated "If, then..."

Element are Knowable

Largely Predictable outcome

Algorithm – driven structured

orders, decision making

ATB tolerance / Intolerance

Variable Provider autonomy

Aim: Reliability

Simple,	Complicat	ted , Con	nplex Fra	mework

Health care today harms too frequently and routinely fails to deliver its potential

benefits. It lies not just a gap but a chasm

The Institute of Medicine 2001

TO ERR IS HUMAN

: Building a safer health system

The Institute of Medicine 1999

N.B Safety is providing care and services in a manner that

minimizes the risk of avoidable harms

The Patho Physiology of Error

"Cognitive Theory" By James Reason: 2 Types of mental functioning

1. <u>Autonomic and Unconscious function</u>: Schemata = Informational variables / slots เช่น อาบน้ำ แปรงฟัน ขับรถไปทำงาน

2. Conscious and deliberate function: Slow, Sequential, Laborious

"A Model of Error" By Rasmussen: 3 levels of human performance

First level : **SKILL-BASED** = Unconscious, schemata – based activities

เช่น ลืมปิดไฟ , ลืมกุญแจ , ลืมของ

Second level: RULE-BASED = We try to match patterns from previous experience

การเดินไปทำงานที่เดิมในวันเสาร์-อาทิตย์

Third level: **KNOWLEDGE-BASED** = Slow, laborious, analytic process

เช่น วินิจฉัยผิด

The meaning of ERRORS

- 1. Malfunctioning schemata at the unconscious
- level (Skill based or rule based) \Rightarrow SLIPS OR LAPSES
- (The plan is correct but the actions fail)
 - 2. Misjudgment at the conscious level (rule based
- or knowledge − based) → <u>mistakes</u> (The plan is incorrect)

The causes of Human ERRORS

- 1. "Personal" Interruptions = multitasking, fear, stress, anger, fatigue, alcohol.
- 2. "Environmental" Interruption = noise, heat, unusual stimuli, lack of visibility.
- 3. Lack of knowledge and accurate information.

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

Latent Conditions and Active Failures

Latent Conditions

Active Failures

Equipment

Training gaps

Technologies

Staff storages

Improper staffs

Poor safety culture

Errors by doctors, nurses, pharmacists

Policies

Summary

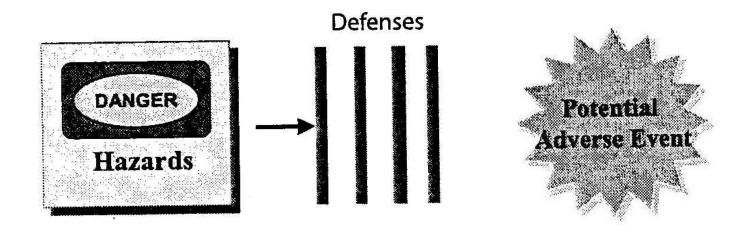

Eliminating or minimizing latent conditions has a greater impact on human error than focusing on an individual active failure.

Chapter 1: An Overview of Patient Safety and Its Impact on Facility design

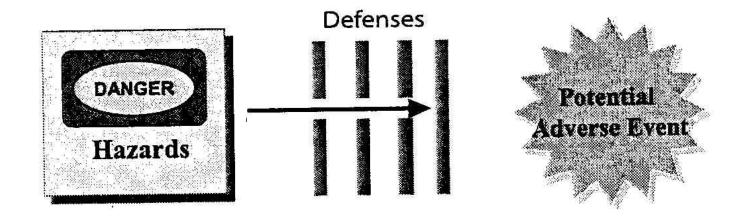

Hazards are inherent in health care — it's part of "the business." Defenses can be hardware (e.g., monitors), people (e.g., nurses), or administrative (e.g., acceptable protocols)

(From Managing the Risks of Organizational Accidents, Reason, 1997)

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University 💈

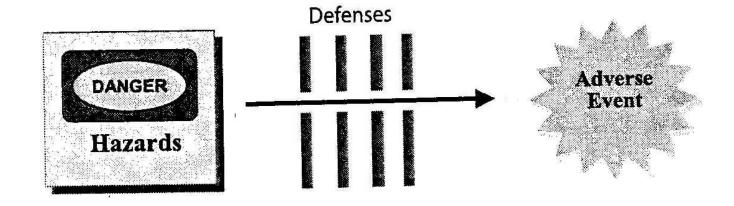

Usually several defenses must fail to cause an accident-Just one remaining intact is enough to prevent a near miss becoming an accident...

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University 💈

Safe by Design: Designing Safety in Health Care Facilities, Processes, and Culture

What is "the cause"? The hazard? Failure of which defense?

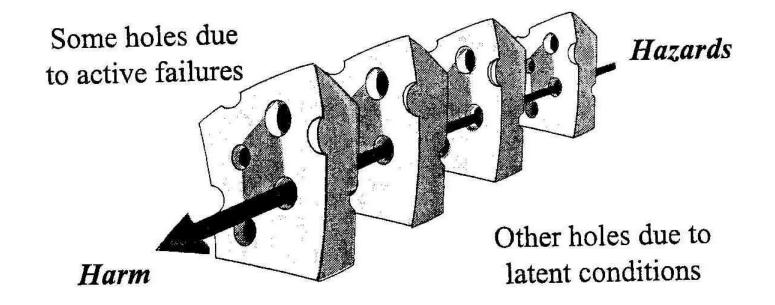

This is the problem with assigning single causes...

Blame/cause often is assigned to the <u>last</u> barrier – usually a person – to fail!!

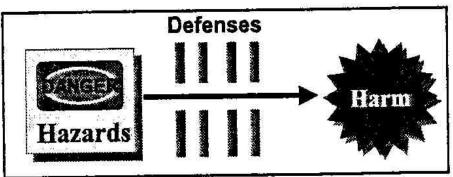

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

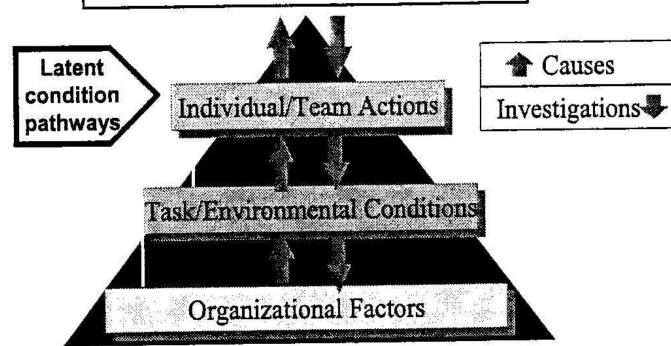

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

Pyramid of Clinical Incidents

Greatest direct Financial and

Reputational Impact

Goal Healing and imitigation

Greatest Impact on Culture of

Safety and Service

Goal Safety and reliability

Safety is providing care and services in a manner that minimized the risk of avoidable harms **Reliability** is doing the right thing at the right time in the right place

Murphy's Law and Risk Matrix

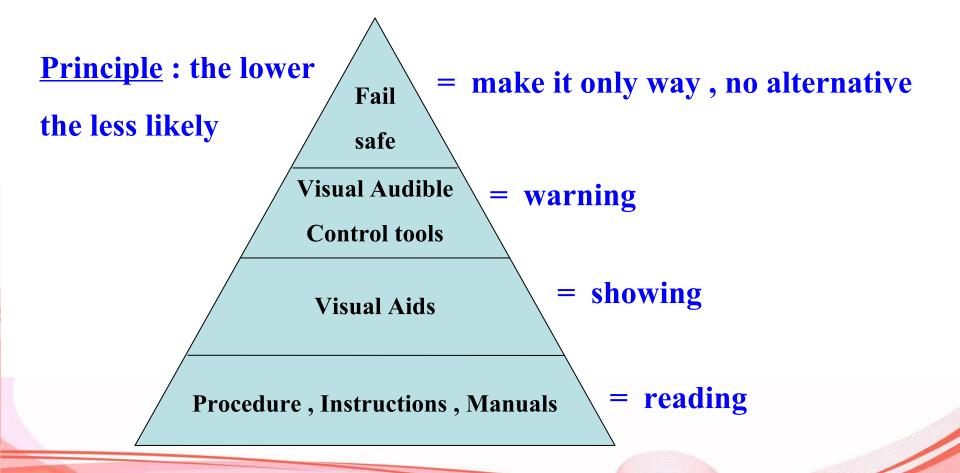

If an incidence is frequency repeated and there is a small chance each time that something will go wrong, sooner or later it will go wrong. So the combination of error probability and consequence loss will help to determine what compliance measures should be implemented.

GOAL

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

How to develop a culture of safety

Knowledges

Know What ?

- 1. Healthcare is complex system.
- 2. "To Err is Human"
- 3. The limits of human factors.
- Safety design principles.
- 5. Characteristics of high-reliability organization.
- 6. Patient safety resources.

Skills

Know How?

- 1. Effective use of technology and standardized practices.
- 2. Effective use of strategies to reduce risk or harm.
- 3. Appropriate strategies to reduce reliance on memmory.
- 4. Communication the hazards and errors to patients families and health care team.
- 5. Organizational error reporting systems.
- 6. Analyzing errors and designing system improvement.
- 7. Engage in root cause analysis rather than blamming.

Attitudes — Know Why? Know Exception?

- 1. Value the contributions of standardization/reliability to safety.
- 2. Appreciate the cognitive and physical limits of human performance.
- 3. Value own role in preventing errors.
- 4. Value vigilance and monitoring patients, families, and other members of the health care team.

Know Application

Making on a culture of safety begins with learning how to learn about safety.

Voluntary error reporting system

Versus

Mandatory error reporting system

" Electronic Reporting Process "

Versus

" Traditional Reporting Process"

How to increase error reporting?

- 1. Leadership committed to patient safety.
- 2. Eliminating a punitive culture / blame free culture.
- 3. Increasing reporting of near misses.
- 4. Providing timely feedback and follow-up actions and improvements to avert future errors.
- 5. Having a multidisciplinary approach to reporting.

The goal of a culture of safety is to "minimize the RISK (Risk) of harm to patients and providers through BOTH system effectiveness and individual performance"

Cronenwett et al.,2007

Threats to patient safety and errors

- Extremely complex and inherently risk-prone system.
- Lack of comprehensive verbal, written, and electronic communication systems.
- Tolerance of individualistic practices and lack of standardization.
- Fear of retribution inhibiting reporting.
- Organizational lack of ownership for patient safety.

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

Elements of a culture of safety

- Safety as an organizational priority by shared core values and goals.
- Effective teamwork to accomplish the goal of safe, high-quality patient-care.
- Patient involvement
- Openness/transparency
- Accountability

Lamb et al,2003

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

Human factors is the science of the relationship between humans, the technology they use, and the environment in which they work

Handoffs or Handover communications

- Transition in care and handoffs/handover for effective communication is face-to-face communication.
- <u>Definition</u>: the real time process of passing patient specific information from one caregiver to another or from one team of caregiver to another for the purpose of ensuring continuity and safety of the patient/client/resident's care (SBAR: situation, background, assessment, and recommendation)

Process for examine safety threats

- Root cause analysis (RCA) after all sentinel events.
- Failure mode effective analysis (FMEA)

Disclosure of errors to patients

Accountability to patients and families is a hallmark of a culture of safety.

<u>Making care safer</u>: <u>Nine categories that provide opportunities to</u> <u>improve patient safety.</u>

- 1. <u>User-centered design</u> to easier for clinician to do the right action.
- 2. Avoid reliance on memory: protocols and checklists, default in an electronic order
- 3. <u>Attend to work safety</u>: work hours, workloads, staffing ratios, distractions, interruptions
- 4. <u>Avoid reliance on vigilance</u>: well-designed alarms, rotating staff and breaks.
- 5. <u>Training concepts for teams</u>: intra-and interprofessional communication and collaboration.

- 6. <u>Involve patients in their care</u>: knowing the plan of care, holding round in patient rooms, having patients/families participate.
- 7. <u>Anticipate the unexpected</u>: pilot testing for new processes and technologies.
- 8. <u>Design for recovery</u>
- 9. <u>Improve access to accurate, timely information</u>: drug formularies, evidence-based practice protocols, patient records, laboratory reports.

Openness is a critical factor in a culture of safety.

It indicates there is acceptance of human elements

in error and a means of reporting any error or near

miss or identified potential for error.

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

Within a culture of <u>openness</u>, there is a "Just culture" where discipline is limited to reckless or egregious behavior.

Safety Culture and High-reliability Organization

All employers fully engaged in the process of detecting high-risk situations, there are resources dedicated to bringing about the changes suggested, everyone is empowed to act in dangerous situation, there is a work environment that is fair to employers.

" Near Misses" versus " Adverse Event"

- 1. Valuable information regarding in systems that predispose to adverse events.
- 2. Discussion of near-misses usually do not generate the defensive reaction.

Who is "Second Victim"

Concept There should the systems that help the professional to understand the event, to stimulate healing, and to improve the health care system.

คณะแพทยศาสตร์โรงพยาบาลรามาธิบดี Faculty of Medicine Ramathibodi Hospital, Mahidol University

Ramathibodi Strategic Line of Sight

Clinical Risk Management with Ramathibodi Microsystem

<u>Philosophy</u> To Err is Human → Medical Error →

Preventable Adverse Event

Aim In Microsystem, Safety should be a

precondition

Steps I. Created Safety Environment

II. Built Safety Culture

III. Done Safety Practice

IV. Measured Safety Climate

I. Created Safety Environment By Leaders

- 1.1 Policies: Ramathibodi Safety Hospital with No Zero Event
 - Transparent Disclosure
- 1.2 Allocate Resources to Patient Safety
- 1.3 Commitment Thought Activities and Conversations
- 1.4 Promise Making and Forgiveness

II. Built Safety Culture

- 2.1 Systemic Thinking Approach (Work, Human and Organization Condition)
- 2.2 Blame free Culture
- 2.3 Just Culture
- 2.4 Reporting Culture
- 2.5 Transparent Judgement with Accountability

III. Done Safety Practice

- 3.1 Assess and Improve Process in Healthcare System
 - e.s. 5Ps Model, 5s Method, SIMPLE, Surgical Safety Checklist, Hand Washing, Lean, Risk Matrix, Electronic Medical Record, Medical Reconciliation.

- 3.2 Tracking Near Miss and Medical Errors
 - 3.2.1 Improve Voluntary Report System
 - 3.2.2 Review Medical Errors and AE Data
 - 3.2.3 Information Feedback
 - 3.2.4 Learn from Error

3.3 Immediate Response to Error

For Patients and Families

- 3.3.1 Disclosure
- 3.3.2 Apologize
- 3.3.3 Compensation

For Involved Healthcare Workers

Immediate Treat with Sympathy, Understanding and Emotionally Support

IV. Measured Safety Climate

- 4.1 Surveys of Healthcare Worker Attitude
- **4.2** Observe Non-Punitive Culture in Microsystem Unit
- 4.3 Reporting
 - 4.3.1 Potential Safety Event or Near miss
 - 4.3.2 A, B Occurrence Report
 - 4.3.3 Incidence Across Different levels

Patient Safety as freedom from accidental injury

The Institue of Medicine (IOM, 1999)
